

WATER - the Healthiest Drink on Earth Everybody knows that water is essential for life. We all know about its impact on our health and beauty. What, though, do we know about the water itself? Mineral water is extracted from the interior of Earth, from geologically separated reservoirs, and thus protected from external contaminants. It contains minerals beneficial to our health, such as magnesium, calcium, sodium and potassium. The most important parameter to be taken into account when we choose our water is mineral content expressed in milligrams per litre and water pH, i.e. alkalinity.

JANTAR water is drawn from artesian spring number 39 in Kołobrzeg. Its composition includes ground water from 9.8 thousand years ago and inflow water which has undergone a 40-year natural filtration process. In addition, it is enriched with minerals from the permian salts which were deposited over millions of years at the bottom of the ancien oceans.

JANTAR is a top-quality medium-mineralised water with analkaline pH, an important factor which helps it balance th eacidity of all manner of foods and drinks, including acidifying foods.

JANTAR water optimally hydrates the body thanks to a unique composition of electrolytes and trace elements.

> Jantar Water is recommended for athletes and health-conscious people

> IT IS NOT THE QUANTITY BUT THE QUALITY OF CONSUMED WATER!

- Drinking large amounts of water with a low content of minerals, i.e. electrolytes, can be dangerous to the health according to Professor Roger Corder from the William Harvey Research Institute in London. Large amounts of water without electrolytes can leach the mineral reserves, including: sodium, potassium, calcium, magnesium and numerous trace elements.
 - The loss of these important components can lead to a risk of collapse resulting from sudden blood pressure drop or life-

threatening arrhythmia. Tests of blood samples taken from 488 runners at the Boston marathon finish line in 2002 demonstrated that 13% of the subjects had abnormally low blood sodium levels, known as hyponatremia, which is a life-threatening condition. The majority of the subjects with low sodium levels had been drinking more than 3 litres of water per day.

During sports, heavy physical work, as well as on hot days, there is high perspiration and salt excretion from the body (Table 1 – sweat composition), which can cause their deficit resulting in weakness, tiredness etc. Drinking chloride-sodium water in such situations allows one to replenish salt losses, affect our feeling of well-being, as well as improving body endurance (Table 2 – composition of JANTAR water).

Table 1 What is lost in perspiration?		Table 2 Jantar Water		
Mineral mg/l		Minerals total: 803.95 mg/l		
Sodium	1200	Cations	(mg/l)	
Chlorine	1000	Sodium (Na <mark>+</mark>)	167.0	
Potassium	300	Calcium (Ca ²⁺)	52.1	
Calcium	160	Magnesium (Mg ²⁺)	15.8	
Magnesium	36	Potassium (K <mark>+</mark>)	5.0	
Phosphate	15	Anions		
Zinc	1.2	Chloride (Cl <mark>-</mark>)	212.7	
Iron	1.2	Carbohydrate (HCO ₃ -)	322.9	
Manganese	0.06	Sulphate (SO ₄ ²⁻)	16.7	
Copper	0.06	lodide (<mark>l⁻)</mark>	0.02	

Don Colbert, MD, from the United States has referred to alkaline water as the leading and most important factor in restoring good health. The majority of his patients became free of diseases after only a few months of treatment involving drinking alkaline water and consuming alkaline food.

Another American scientist, Dr. R. Young, has discovered that harmful micro-organisms cannot grow when the blood maintains its biochemical balance, i.e. when pH is 7.4. Staying in acid-base balance stimulates the formation of new, healthy cells and supports the regeneration process. On the other hand, lowering blood pH to acidic levels causes weakening of cells, mutations, as well as their dying out.

The high quality of blood (i.e. correct alkaline pH) guarantees an increase in energy and vital forces, improves well-being and concentration. If blood pH is in the range of 7.4, then all the processes in human cells are performed ideally.

HYDRATION

In the daily diet, it is the quality and not the quantity of the water consumed that plays the most important role. During sports, heavy physical work, as well as on hot days, there is high perspiration and salt excretion from the body. This may cause its deficit, which manifests as weakness, tiredness and similar.

To supplement salt losses you can drink chloride-sodium water. This also has a beneficial effect on our well-being and helps to achieve better physical fitness.

During heat waves and strenuous exercise it is advised not to drink large quantities of water without mineral salts, as this leads to the dilution of the electrolytes in the body, which stimulate things like the heartbeat and muscular endurance. Leaching of electrolytes, mainly sodium, can lead to so-called hyponatremia – a medical condition caused by the decrease in blood sodium levels.

JANTAR, as a chloride-sodium water, is perfect for replenishing these electrolytes lost during perspiration. So let's drink JANTAR water, containing a balanced set of electrolytes and trace elements!

Hyponatremia and preventing dehydration

Hyponatremia is a condition involving a decrease in blood sodium content (below 130 mmol per 1 l), which leads to the disruption or non-activation of cellular function and in extreme cases can lead to death. Hyponatremia is usually a result of long-term and profuse sweating, with no sodium supply, or it may result from excessive water consumption. It is a common condition in endurance athletes.

Providing an appropriate amount of liquids is a primary method of regenerating the body after physical exercise. Water without electrolytes is quickly eliminated with the urine and deprives the organism of some electrolytes. For quick hydration of the body, it is essential to drink a natural hypotonic water like JANTAR (better absorption, even up to 40%) or commercial isotonics.

We recommend the healthy, natural isotonic based on JANTAR mineral water, which can be prepared at home. If the drink contains minerals of a composition similar to bodily fluids (such as JANTAR water), the loss of electrolytes will be compensated.

Water Parameters

NA ZDROWIE SPORTOWCÓW WPŁYW WODY JANTAR

aktywny tryb życia. stylu życia. Wyjątkowy skład klasyfikuje ją jako wodę chlorkowo – sodową, szczególnie polecaną dla osób prowadzących dorosiego coloweka na jod. Naturalnie czysta i niczym nieuzdatniana woda Jantar stanowi obalne uzupelnienie zdrowego nego w badanlach na podom elektrolitów w osoczol, Wypicie 2,5 litra wody JANTAR zaspakaja dzienne zapotozebowanie pompy sodowo-potasowej. Jako jedyna na świecie poslada doskonały stosunek potasu do sodu (zbitony do rekomendowaselen), dzięki którym dostanaje nawadnia organizm oraz gast pragnienie. Zawartość sodu i potasu wspomaga działanie bultet elektrolitów nawadniających (sód, chlor, wapń, magnez) oraz wiele pierwiastków śladowych (jod, cynik, stront Woda JANTAR to najwyższej jakości naturalna woda średniszmineralizowana o zasadowym odczynie. Zawiera unikalny

sportowców, którzy ją piją na codzień między innymi Bartosza Huzankiego – kolarza. Prof. di hab. Michala Nowickiego (Nefrolog, Hipertensjolog) Prezesa Polskiego Towarzystwa Nefrologicznego, a także od wielu Paristwowego Instytutu Badawczego oraz Pokikiego Towarzystwa Dietetyki Sportowej. Poslada wiele rekomendacji w tym od JANTAR jako pierwsza woda o charakterze sportowym w Polsce uzystała pozytywną opinę instytutu Sportu -

Górniczo-Huthiczej w Krakowie do najwyższej klasy jakości: Klasa i – wody bardzo dobnej jakości. Woda JANTAR w 2016 roku została zakwalifikowana przez Laboratorium Hydrogeochemiczne z Akademii

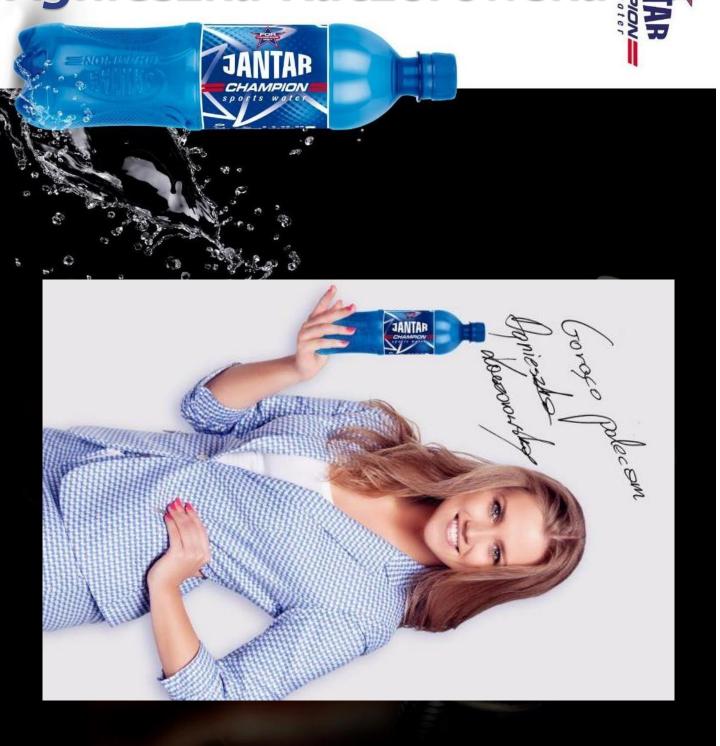

oraz mineralnymi, z punktu żywienia sportowca jest fakt, iż: Zaletą wody JANTAR, w porównaniu z innymi wodami źródlanymi

- wodą średniazmineralizowaną czyli najlepszą do picia na co cbień ada odpowiedni stosunek potasu do sodu dzięki, któremu prawidow
- acuje pompa sodowo-potazowa u człowieka. so woda chlorkowo-sodowa szybko i skutecznie nawachia
- ymanie wewnętrznej równowaji wodno-elektrolitow ada wodorowęglany HCO₃ doskonały czynnik popr edni paziom sodu, potazu oraz chlorku zapewnia
- towana woda posiada pH w przedziałe 7,4 + 7,7,

- ra pierwiastia sladowe takie jak jod, selen, cynkoraz stront
- wodzienie występują metale ciężkie, pestycydy ani żadne stężen topów radonu, radu i uranu
- jest bardzo czystą wodą pozbo
- ania nie używa się substancji chemicznycl
